(54) Amorphous perfluorinated copolymers

(57) Amorphous perfluorinated copolymers, comprising cyclic perfluorinated units deriving from at least two different perfluorinated comonomers, optionally with units deriving from a perfluorinated monomer containing at least one olefinic unsaturation (perfluoroolefin), or comprising cyclic perfluorinated units and units deriving from a perfluorinated monomer containing at least one olefinic unsaturation, said perfluorinated copolymers having the following combination of proper-

ties:

- substantial absence of unstable polar end groups,
- polymer Tg higher than 120°C,
- narrow monomeric composition distribution.

EP 1 256 592 A1

Description

[0001] The present invention relates to amorphous perfluorinated polymers for optical applications, in particular optical fibers, the preforms obtained therefrom, and a process for preparing said polymers.

[0002] With the term "preform" it is generally meant a compact and transparent solid formed by polymers having optical properties.

[0003] The polymer optical fibers (POF) have a core-sheath structure. Compared with the optical fibers wherein the core is based on quartz or multicomponent glass, POFs generally show the following advantages:

- higher diameter,
- improved flexibility (according to "bending test")
- improved number opening (difference of the refractive index between core and sheath),
- improved connection easiness to the light source.

[0004] Polymer optical fibers having a core of polymethylmethacrylate, polystyrene or polycarbonate and a sheath of a perfluoroalkylmethacrylate polymer are at present on the market. At wave lengths of 400-600 nm polymethylmethacrylate POFs show a good attenuation, of the order of 150-400 dB/Km. At wave lengths higher than 650 nm the attenuation of said POFs becomes very high. This represents a drawback since on industrial scale sources of light at wave lengths higher than 700 nm, up to the near infrared, are used.

[0005] USP 4,966,435 describes POFs having a good transmission to the light both in the visible spectrum and in the near infrared and an excellent thermal resistance. In said fibers the core is a copolymer of a PD or PDD perfluorodioxole. Said copolymers are substantially amorphous, have a Tg higher than 100°C, a refractive index which can be controlled between 1.29 and 1.40 in function of the comonomer, and can easily be transformed into optical fibers having an uniform diameter. The thermal resistance of said substantially amorphous copolymers is high, the number of the unstable end groups being lower than 5 meq/Kg, preferably lower than 2 meq/Kg. This reduced number of end groups is obtained by treating the polymers with amines or alcohols and subsequently by reacting with fluorine at a temperature lower than the polymer Tg and comprised between 20°C and 200°C. The sheath is formed by a PD/TFE copolymer. The core-sheath fibers obtained according to said patent have an attenuation of 270 dB/km at 650 nm, 330 dB/Km at 780 nm and 285 dB/km at 1,550 nm. Said values are too high for "last mile" or LAN (Local Area Network) applications, wherein an attenuation lower than 100 dB/km in the range 700-1,550 nm is required.

[0006] EP 710,855 describes graded refractive index POFs having an improved band amplitude, formed by an amorphous polymer and by at least another polymer (doping agent) having refractive index different of at least 0.001 units from that of the amorphous polymer. The doping agent is distributed in the fiber so as to have a concentration gradient from the centre to the cable periphery. The fluoropolymer contains cyclic structures; in particular when alicyclic polymers are used the attenuation is higher than 100 dB/km at a wave length between 700 and 1,550 nm. Said attenuation results too high for LAN applications.

[0007] EP 752,598 describes graded refractive index POFs similar to those of previous patent, wherein a third component, having a specular concentration gradient with respect to that of the doping agent, is used, to maintain constant the Tg along the fiber diameter. As third component a perfluoropolyether having the structure

is used, wherein n1 is an integer from 1 to 3. Preferably the number average molecular weight of the perfluoropolyether is from 300 to 10,000. In the Examples of said patent it is described that fibers having a Tg of 82°C can have an attenuation of 100 dB/Km at 780 nm and 65 dB/Km at 1,550 nm. In the comparative Examples it is shown that in absence of PFPE the attenuation increases to 400 dB/Km at 780 nm, and to 280 dB/Km at 1,550 nm, while the Tg ranges from 82°C in the core to 102°C in the sheath respectively. In absence of PFPE microvacua are present in the fibers. The optical fibers obtainable according to said patent have the drawback to have a very low Tg for LAN applications, which require a fiber Tg higher than 100°C (S. Ando, et Al. ChemTech. Dec. 1994 20-27).

[0008] The need was felt to have available amorphous perfluorinated polymers for optical applications in particular for optical fibers, having the following combination of properties:

- attenuation values lower than 100 dB/km at wave lengths from 500 to 1,550 nm;
- Tg higher than 120°C;
- high thermal resistance;
- narrow distribution of the monomeric composition of the amorphous perfluorinated copolymer according to the following test: the polymer is dissolved at a concentration of 5% w/w in perfluoroheptane solvent, after filtration on

PTFE filter having a maximum pore diameter of 0.2 micron, no polymer residue remains on the filter; the filter weight before and after filtration remains unchanged.

[0009] The Applicant has unexpectedly and surprisingly found perfluorinated amorphous polymers which solve this technical problem.

[0010] An object of the present invention are amorphous perfluorinated copolymers, comprising cyclic perfluorinated units deriving from at least two different perfluorinated comonomers, optionally with units deriving from a non cyclic perfluorinated monomer, or which does not cyclize during the polymerization, containing at least one olefinic unsaturation (perfluoroolefin), or comprising cyclic perfluorinated units and units deriving from a non cyclic perfluorinated monomer, or which does not cyclize during the polymerization, containing at least one olefinic unsaturation, said perfluorinated copolymers having the following combination of properties:

- substantial absence of unstable polar end groups, in particular end groups as COF, COOH or their amidic derivatives, esters or salts; said end groups being not detectable in the copolymer, i.e. present in an amount lower than 0.05 mmoles/kg polymer when they are determined by Fourier transform IR spectroscopy by Nicolet® Nexus FT-IR equipment (256 scanings, resolution 2 cm⁻¹), wherein:
- on a sintered polymer powder pellet having 5 mm diameter and thickness from 50 to 300 micron (corresponding to a weight of 1.75 and 10.5 mg of polymer, respectively) a scanning between 4,000 cm⁻¹ and 400 cm⁻¹ is initially carried out, the pellet being then kept for 12 hours in an environment saturated with ammonia vapours;
- the IR spectrum is finally recorded under the same conditions of the initial IR spectrum;
- the two spectra are elaborated by subtracting from the signals of the spectrum relating to the untreated sample (initial spectrum) those corresponding to the specimen spectrum after exposure to ammonia vapours;
- the "difference" spectrum is obtained, which is normalized by the following equation:

$$\frac{\text{"Difference spectrum"}}{[\text{pellet weight (g)/pellet area (cm}^2\text{)}]}$$

- the optical densities related to the end groups which have reacted with the ammonia vapours are measured, which give rise to detectable peaks in the IR spectrum, said end groups being the COOH and COF groups;
- the optical densities are converted in mmoles/kg polymer using the extinction coefficients reported in Table 1, page 73 of the paper by M. Pianca et Al. "End groups in fluoropolymers", J. Fluorine Chem. 95 (1999), 71-84' (herein incorporated by reference); the so found values give the concentrations of the residual polar end groups as mmoles of polar end groups/kg polymer; in the spectrum of the amorphous (per)fluorinated polymers after fluorination bands related to COON groups (3,600-3,500, 1,820-1,770 cm⁻¹) and/or COF groups (1,900-1,830 cm⁻¹) are not detectable, the method detectability limit being 0.05 mmoles/Kg polymer;
- polymer Tg higher than 120°C, preferably 125°C;
- narrow distribution of the monomeric composition of the amorphous perfluorinated copolymer measured according to the following test: the polymer is dissolved at a concentration of 5% w/w in perfluoroheptane solvent, after filtration on PTFE filter having a maximum pore diameter of 0.2 micron, no polymer residue remains on the filter whereby the filter weight before and after filtration remains unchanged.

[0011] The amorphous perfluorinated polymers according to the present invention do not substantially contain C-H bonds.

[0012] The perfluorinated monomers which give polymers containing cyclic structures, are selected from the following:

- perfluorodioxoles, wherein optionally one or two fluorine atoms are substituted with chlorine atoms;
- non conjugated dienes having the following formulas:

wherein X¹ and X², equal to or different from each other, are F, Cl; X³ and X⁴, equal to or different from each

other, are F or CF₃, which during the polymerization cyclopolymerize.

[0013] The preferred perfluorodioxoles are those having the following formula:

wherein R'_F is equal to F, R_F, or OR_F wherein R_F is a linear or branched when possible perfluoroalkyl radical having 1 - 5 carbon atoms; X₁ and X₂ equal to or different from each other being F or CF₃.

[0014] Preferably in formula (IA) R'_F = OR_F, R_F, is preferably CF₃; X₁ = X₂ = F, and the compound is known as TTD. Another preferred cyclic monomer is that having formula (IA) wherein R'_F = F; X₁ = X₂ = F, and the compound is known as PD.

[0015] The non cyclic perfluorinated comonomers, or which do not cyclize during the polymerization, containing at last one ethylene unsaturation, are selected from the following:

- C₂-C₈ perfluoroolefins, such as TFE, hexafluoropropene (HFP);
- (per)fluoroalkylvinylethers (PAVE) CF₂=CFOR_F, wherein R_F is a C₁-C₆ (per)fluoroalkyl, for example CF₃, C₂F₅, C₃F₇;
- perfluoro-oxyalkylvinylethers CF₂=CFOX, wherein X is: a C₁-C₁₂ alkyl, or a C₁-C₁₂ oxyalkyl, or a C₁-C₁₂ perfluoro-oxyalkyl having one or more ether groups, for example perfluoro-2-propoxy-propyl.

[0016] The perfluorinated polymers of the invention can contain also as non cyclic comonomer or which does not cyclize during the polymerization, containing one ethylene unsaturation, in substitution or in addition to the above comonomers, also non cyclic C₂-C₈, fluoroolefins or which do not cyclize during the polymerization, containing one or two chlorine atoms, such as chlorotrifluoroethylene (CTFE).

[0017] When the amorphous polymer optionally contains units deriving from a non cyclic perfluorinated monomer, or which does not cyclize during the polymerization, containing at least one olefinic unsaturation, it contains cyclic units deriving from either different cyclic monomers or a cyclic monomer and a monomer which cyclizes during the polymerization.

[0018] The amounts expressed in per cent by moles of cyclic units deriving from either different cyclic monomers or a cyclic monomer and a monomer which cyclizes during the polymerization range from 60% to 100% by moles, preferably from 80% to 100%.

[0019] When the amorphous polymer contains units deriving from a non cyclic perfluorinated monomer or which does not cyclize during the polymerization and containing at least one olefinic unsaturation, it contains cyclic units deriving from a cyclic monomer, or from two different cyclic monomers, or from a cyclic monomer and a monomer which cyclizes during the polymerization.

[0020] The amounts expressed in per cent by moles of cyclic units deriving from a cyclic monomer, or from two different cyclic monomers or from a cyclic monomer and a monomer which cyclizes during the polymerization range from 60% to 99.5%, preferably from 80% to 95%.

[0021] When the copolymer contains units deriving from a non cyclic perfluorinated monomer or which does not cyclize during the polymerization and containing at least one olefinic unsaturation, it can optionally be present a second non cyclic perfluoroolefin or which does not cyclize during the polymerization, different from that already present, selected from the above non cyclic perfluoroolefins or which do not cyclize in polymerization, in amounts in per cent by moles from 0 to 20%, preferably lower than 10%.

[0022] The preferred copolymers according to the present invention are the copolymers obtained by copolymerizing:

- the perfluorodioxoles of formula (IA) having TTD structure, with TFE;
- the perfluorodioxoles of formula (IA) having TTD structure, with perfluorodioxoles of formula (IA) having PD structure.

[0023] The dioxoles and their copolymers, before being subjected to the process according to the present invention,

as described hereafter, are prepared by polymerization for example according to USP 5,498,682 and USP 5,883,177. The amorphous polymers can be prepared according to polymerization methods in emulsion, suspension and bulk according to known methods of the prior art. In particular amorphous polymers can be prepared by monomer copolymerization in aqueous emulsion, according to known methods of the prior art, in the presence of radical initiators for example alkaline or ammonium persulphates, perphosphates, perborates or percarbonates, optionally in combination with ferrous, cupreous or silver salts, or other easily oxidizable metals. In the reaction medium also anionic, cationic and non ionic, hydrogenated and fluorinated surfactants are usually present, among which fluorinated surfactant are particularly preferred. The polymerization reaction is generally carried out at temperatures in the range 25°-150°C, using a pressure up to 10 MPa. The preparation of amorphous perfluorinated copolymers is preferably carried out in microemulsion of (per)fluoropolyoxyalkylenes, according to USP 4,789,717 and USP 4,864,006. Optionally in polymerization well known chain transfer agents of the prior art can also be used.

[0024] The determination of the narrow distribution of the monomeric composition of the amorphous perfluorinated polymer of the invention, as said, is carried out according to the following test: the polymer is dissolved at a 5% concentration w/w in perfluoroheptane, after having filtered the solution on PTFE filter having a maximum pore diameter of 0.2 micron, no polymer residue remains on the filter; in other terms the filter weight before and after filtration remains unchanged.

[0025] A further object of the present invention is a process for preparing the above perfluorinated polymers, including also the homopolymers formed by cyclic units deriving even from only one cyclic monomer or from a monomer which cyclizes during the polymerization, comprising the following steps:

- I) dissolution of the amorphous perfluorinated polymer in a solvent inert to fluorination, having solubility parameter defined as in Polymer Handbook 3th ed. page VII 519, (Ed. Brandrup and Immergut), from 5.5 to 8.2 (cal/cm³)^{1/2}, the polymer being dissolved at a concentration, expressed in per cent by weight, from 0.5% to 15%, preferably from 3% to 8%;
- II) polymer fluorination in solution by treatment with elementary fluorine, optionally in admixture with inert gases, in the presence of ultraviolet radiations having a wave length from 200 to 500 nm, at temperatures lower than 100°C;
- III) solution filtration on PTFE filter having a maximum pore diameter of 0.2 µm, recovery of the filtrate; the filtrate contains the amorphous perfluorinated polymers of the present invention usable for optical applications;
- IV) optionally, solvent removal and recovery of the amorphous perfluorinated polymers usable for optical applications.

[0026] In step I) one must use, as said, at least a solvent inert to fluorination, having solubility parameter defined as in Polymer Handbook 3th ed. page VII 519, (Ed. Brandrup and Immergut), from 5.5 to 8.2 (cal/cm³)^{1/2}. Solvents which satisfy the solubility parameter are preferably selected from perfluoroheptane, known as Galden®D80, perfluorobutyl-tetrahydrofuran, perfluoropropyl-tetrahydropyran, perfluoropolyether having b.p. 165°C, known as Galden®LS 165, tertiary perfluoroamines, etc.

[0027] In step I) to the organic solution also a doping compound can optionally be added, in an amount expressed in per cent by weight on the perfluoropolymer, from 1% to 30%, preferably from 5% to 20%. With doping compound (see hereunder) a substance is meant whose refractive index differs from that of the perfluoropolymer of at least 0.001 units, preferably of 0.005 units.

[0028] In step II) the used radiation has a wave length ranging from 200 to 500 nm; a mercury lamp Hanau TQ 150 can for example be used. By fluorination the amount of polar end groups in the polymer is reduced and results undetectable with the above described infrared spectroscopy method. Therefore their residual amount is lower than the method detectability limit which, as said, is of 0.05 mmoles/kg polymer. The reaction temperature in step II) ranges from 0°C to < +100°C, preferably from +20°C to +50°C.

[0029] As said, the determination of the polar end groups before and after fluorination is carried out by IR spectroscopy, performing a scanning between 4,000 cm⁻¹ and 400 cm⁻¹, on a sintered polymer powder pellet which can have a thickness from 50 to 300 micron. The fluorination process ends when by IR spectroscopy bands related to COON groups (3,600-3,500, 1,820-1,770 cm⁻¹) and/or COF groups (1,900-1,830 cm⁻¹) are no longer detectable. The method detectability limit is 0.05 mmoles/Kg polymer.

[0030] In step III) the temperature at which the filtration is carried out is in the range 0°-100°C, preferably it is the room temperature (20°-25°C).

[0031] In step IV) the solvent is removed by means of known methods, for example by stripping under vacuum.

[0032] The amorphous perfluorinated polymer obtained at the end of the process according to the present invention, shows the combination of the above properties:

- attenuation values lower than 100 dB/km at wave lengths from 500 to 1,550 nm;
- Tg higher than 120°C;

- high thermal resistance;
- narrow distribution of the monomeric composition as above defined.

[0033] The amorphous perfluorinated polymer obtained at the end of the process according to the present invention when step IV) is carried out, can be processed to obtain the preform. In this case the polymer is introduced in a vessel, for example of glass or porcelain, or metal coated by semi-crystalline fluoropolymers, such for example PFA, FEP, PTFE, then the temperature is increased over the fluoropolymer T_g, preferably to values from 50°C to 100°C higher than the fluoropolymer T_g. The temperature is kept for a time sufficient to allow the polymer compacting by gravity, or by applying a pressure. Optionally it is possible to use vacuum and pressure cycles. At the end of the treatment the temperature is gradually lowered to room temperature. In said way the preform of the amorphous perfluorinated polymer usable for optical applications is obtained.

[0034] The preform can optionally contain, in a total amount expressed in per cent by weight on the perfluoropolymer, from 1% to 30%, preferably from 5% to 20% of additives, preferably doping agents and/or perfluoropolyethers.

[0035] The used doping agents are fluorinated compounds substantially C-H bonds free and can be selected from the group comprising compounds having a low molecular weight, oligomers and polymers containing an aromatic ring, for example benzenic or naphthalenic, and/or one or more halogen atoms, selected from Cl, Br and Iodine, or a functional group such for example a ketonic group or an ether function. Examples of dopants are: 1,3-dibromo-tetrafluorobenzene, 1,4-dibromo-tetrafluorobenzene, 2-bromotetrafluorobenzotrifluoride, halogenpentafluorobenzene wherein the halogen is as above; decafluorobenzophenone, perfluoroacetophenone, perfluorodiphenyl, chloroheptafluoronaphthalene, bromoheptafluoronaphthalene; chlorotrifluoroethylene oligomers with optionally a second perfluoroolefinic monomer selected from the above fluoropolymer non cyclic monomers.

[0036] Other optional components that the preform can contain are perfluoropolyethers containing in the chain one or more of the following units: -CF₂-CF(CF₃)O-, -CF(CF₃)-CF₂O-, -(CF₂)_{n1}O- wherein n1 is an integer from 2 to 3, -CFX₁O- wherein X₁ = F, CF₃ having number average molecular weight preferably from 300 to 10,000, still more preferably from 500 to 2,500, which can be used as doping agents and as T_g regulators. The perfluoropolyether compounds are well known in the prior art and on the market.

[0037] The homopolymers formed by cyclic units deriving even from only one cyclic monomer or from a monomer which cyclizes during the polymerization, obtainable with the invention process, result novel with respect to the homopolymers available on the market but which have not been subjected to fluorination and filtration steps according to the present invention.

[0038] The polymers obtainable with the process of the present invention and the corresponding preforms optionally comprising also the other above compounds (doping compounds and perfluoropolyethers) are characterized by a high transparency at wave lengths from 500 to 1,550 nm, and are usable for preparing manufactured articles for optical applications, such for example optical wave guides, optical components, optical lens and windows, optical fibers, graded index and step index.

[0039] Tests carried out by the Applicant have shown that by increasing the wave length from 400 to 1,550 nm the attenuation tends to decrease. Therefore on the basis of the attenuation value measured at 514 nm, as indicated in the Examples of the present invention, the attenuation at higher wave lengths is equal to or lower than the values measured at 514 nm.

[0040] The following Examples illustrate the invention without limiting the scope thereof.

EXAMPLES

Attenuation measurement method

[0041] The attenuation calculation has been effected according to the method reported in Koike et Al., Macromolecules, vol. 25 page 4807, 1992.

[0042] The polymer under the form of compact transparent solid cylinder, is subjected to scattering measurements by the Laser Light scattering (LLS) technique. The LLS measurement is carried out on the polymer cylinder immersed in distilled water in an optical glass test tube immersed in toluene. The wave length is 514.5 nm, the laser power has been fixed at 90 mW with a detectability pinhole of 400 μm. The specimen is kept under rotation at 25 rpm to allow a space average during the measurement. The scattering has been measured at 90°, with acquisition times of 0.5 s. The attenuation is calculated considering the scattering intensity independent of the angle. In the calculation only the vertical component of the scattered light has been considered.

Polar (ionic) end group determination by IR spectroscopy

[0043] A small amount of the specimen (3.5 mg) is put under a press (3.5 ton/cm²) and a pellet having a 5 mm

diameter and 100 micron thickness is prepared.

[0044] The spectrum from 4,000 to 400 cm^{-1} is recorded by Nicolet® Nexus FT-IR equipment (250 scanings, resolution 2 cm^{-1}).

[0045] The pellet is transferred in an environment saturated with ammonia vapours. After 12 hours the specimen is taken from the ammonia saturated environment and the IR spectrum is recorded again under the same conditions.

[0046] By subtracting from the signals of the spectrum relating to the specimen as such those corresponding of the specimen spectrum after exposure to ammonia vapours, the "difference" spectrum is obtained, which is normalized by the following equation:

$$\frac{\text{"Difference spectrum"}}{[\text{pellet weight (g)/pellet area (cm}^2\text{)}]}$$

[0047] The optical densities related to the end groups which have reacted with the ammonia vapours are measured. They are generally COOH or COF groups. The optical densities are transformed into mmoles/kg polymer using the extinction coefficients shown in Table 1, page 73 of the paper by M. Pianca et Al. "End groups in fluoropolymers", J. Fluorine Chem. 95 (1999), 71-84. The found values express the concentrations of the residual polar end groups as mmoles of polar end groups/kg polymer. The detectability limit is 0.05 mmoles/Kg polymer.

Polymer Tg determination

[0048] The Tg is measured by DSC.

Test of narrow distribution of the monomeric composition

[0049] The test is carried out with the following procedure:

the polymer is dissolved at 5% concentration w/w in perfluoroheptane having a solubility parameter 5.8, and the obtained solution is filtered on PTFE membrane having a maximum pore diameter of 0.2 micron. After filtration, no polymer residue has to remain on the filter whereby the filter weight before and after filtration must remain unchanged.

EXAMPLE 1

Preparation of copolymer TFE/TTD 20/80

[0050] In a 5 l AISI 316 autoclave, equipped with stirrer working at 650 rpm, after vacuum has been made by oil pump, are introduced in sequence 2,790 ml of demineralized water, 6.67 g/litre H_2O of microemulsion obtained by mixing:

- 7.5 ml of a perfluoropolyoxyalkylene having acid end group of formula:

wherein $n/m = 10$, having average molecular weight 600; - 7.5 ml of an aqueous NH_3 solution at 30% by volume;

- 15 ml of demineralized water;
- 4.5 ml of Galden® D02 of formula:

wherein $n/m = 20$, having average molecular weight 450.

[0051] The autoclave is heated up to 75°C and at this temperature 33.3 g/litre H_2O of TTD are added. The pressure inside the autoclave is brought to 1.4 MPa by TFE gas. Subsequently 210 ml of a solution 0.0925 M of potassium persulphate are introduced. After about 10 minutes the reaction starts. The reaction pressure is kept constant by feeding in a semicontinuous way, at each decrease of the inner pressure of 0.05 MPa, liquid TTD and gaseous TFE in the ratio

by weight TTD/TFE = 1.4. The reaction is stopped after having fed in the whole about 320 g of TTD. The latex is degassed and it has a 15% by weight concentration of solid. It is coagulated by adding HNO₃ at 65% w/w, the polymer is separated from the aqueous phase, it is washed twice with demineralized water and dried in a stove at 85°C for 100 h. [0052] The polymer T_g is about 134.7°C corresponding to a composition by moles 20/80 TFE/TTD. The intrinsic viscosity measured at 30°C in perfluoroheptane (Galden® D80) is equal to 36.6 cc/g. By IR analysis the polymer results to contain a residual amount of the polar COON groups of 6 mmoles/Kg polymer.

EXAMPLE 2

Preparation of a copolymer TFE/TTD 20/80 for optical applications according to the process of the present invention and preform achievement

[0053] 255 grams of the copolymer of Example 1, in the form of white powder are dissolved in 3,000 ml of Galden® D80 maintaining the stirring for 2 hours. The solution is degassed by feeding nitrogen for two hours at 22°C in a 5 l photochemical glass reactor equipped with mechanical stirrer and a mercury vapour immersion UV lamp (Hanau TQ 150) and then subjected to fluorination for 31 h at 35°C by feeding a mixture 1:1 by volume of nitrogen/fluorine in the presence of the UV radiation. The solution after fluorination is filtered on PTFE membranes having a maximum pore diameter of 0.2 µm by a filter under pressure at 0.15 MPa.

[0054] The compound remained on the filter has been characterized by IR spectrum and DSC. The IR spectrum shows that it is a fluorinated polymer containing TTD. The DSC measurement shows for the fluorinated polymer remained on the filter a T_g of 100°C, corresponding to a composition on a molar basis 50/50 TFE/TTD.

[0055] The polymer IR analysis has shown that the concentration of the polar groups is lower than 0.05 mmoles/Kg polymer (method detectability limit).

[0056] The solvent is removed from the filtered solution by evaporation under vacuum with a temperature gradient starting from 50°C up to 280°C, until obtaining the dry polymer.

[0057] The polymer is introduced in a test tube having a length of 20 cm and a diameter of 2 cm, and kept liquid at the temperature of 280°C for one hour, then it is slowly cooled, with a decreasing temperature profile, to room temperature in a time of 12 h. A cylinder having sizes of 2 cm x 5.2 cm (preform) is obtained.

[0058] The polymer cylinder has been subjected to scattering measurements by the Laser Light scattering (LLS) technique as above described. The attenuation is equal to 17×10^{-5} dB/cm (17 dB/km) at 514 nm.

[0059] The polymer IR analysis has shown that the concentration of the polar groups is lower than 0.05 mmoles/Kg polymer (method detectability limit).

[0060] The polymer dissolved at a concentration of 5% by weight in Galden® D80 and filtered on a PTFE membrane having a maximum pore diameter of 0.2 µm does not leave residues on the filter. The filter, dried at 150°C for 1 h and weighed by a precision balance has the same weight as the initial weight.

EXAMPLE 3 (comparative)

Fluorination of a copolymer TFE/TTD 20/80

[0061] 250 g of the polymer prepared according to Example 1 have been treated as in Example 2, omitting the filtration on PTFE membrane having pores of 0.2 µm.

[0062] The polymer IR analysis has shown that the concentration of polar groups is lower than 0.05 mmoles/Kg polymer (method detectability limit).

[0063] A cylinder having 2 cm x 5.2 cm sizes is obtained.

[0064] The polymer cylinder has been subjected to scattering measurements by the Laser Light scattering (LLS) technique as above described. The attenuation is 0.00927 dB/cm (927 dB/km) at 514 nm.

[0065] The polymer dissolved at a concentration of 5% by weight in Galden® D80 and filtered on a PTFE membrane having a maximum pore diameter of 0.2 µm leaves an evident polymer residue on the filter equal to 1.69 g.

[0066] The compound remained on the filter has been characterized by IR spectrum and DSC. The IR spectrum shows that it is a fluorinated polymer containing TTD. The DSC measurement shows for the fluorinated polymer remained on the filter a T_g of 100°C, corresponding to a composition on a molar basis 50/50 TFE/TTD.

EXAMPLE 4 (comparative)

Filtration of a copolymer TFE/TTD 20/80

[0067] Example 2 is repeated omitting only the fluorination step.

[0068] The polymer IR analysis has shown that the concentration of polar groups is of 6 mmoles/Kg polymer.

[0069] A cylinder having 2 cm x 5.2 cm sizes is obtained.

[0070] The polymer cylinder has been subjected to scattering measurements by the Laser Light scattering (LLS) technique as above. The attenuation is equal to 0.06 dB/cm (6,000 dB/km) at 514 nm.

[0071] The polymer dissolved at a concentration of 5% by weight in Galden®D80 and filtered on a PTFE membrane having a maximum pore diameter of 0.2 µm does not leave residues on the filter. The filter, dried at 150°C for 1 h and weighed by a precision balance has the same weight as the initial weigh.

EXAMPLE 5

Preparation of copolymer TFE/TTD 20/80

[0072] The preparation of the copolymer of Example 1 is repeated by obtaining a polymer having a Tg of about 133.1°C. The intrinsic viscosity, measured at the temperature of 30°C in perfluoroheptane is 35.2 ml/g. By IR analysis the polymer results to contain a residual amount of the polar COOH groups of 6 mmoles/Kg polymer.

EXAMPLE 6

Preparation of a copolymer for optical applications according to the process of the present invention, and achievement of the preform, by using the amorphous perfluorinated polymer prepared in Example 5.

[0073] Example 2 is repeated, by using the polymer of Example 5, except the fluorination time, which is 42 h instead of 31 h.

[0074] The compound remained on the filter has been characterized by IR spectrum and DSC. The IR spectrum shows that it is a fluorinated polymer containing TTD. The DSC measurement shows for the fluorinated polymer remained on the filter a Tg of 100°C, corresponding to a composition on a molar basis 50/50 TFE/TTD.

[0075] The polymer IR analysis has shown that the concentration of the polar groups is lower than 0.05 mmoles/Kg polymer (method detectability limit).

[0076] The solvent is removed as described in Example 2 and the polymer treated as described until obtaining a cylinder having 2 cm x 4.3 cm sizes (preform).

[0077] The polymer cylinder has been subjected to scattering measurements by the Laser Light scattering (LLS) technique as above described. The attenuation is equal to 26×10^{-5} dB/cm (26 dB/km) at 514 nm.

[0078] The polymer dissolved at a concentration of 5% by weight in Galden®D80 and filtered on a PTFE membrane having a maximum pore diameter of 0.2 µm does not leave residues on the filter. The filter, dried at 150°C for 1 h and weighed by a precision balance has the same weight as the initial weight.

EXAMPLE 7

Preparation of copolymer TFE/TTD 20/80

[0079] The preparation of the copolymer of Example 1 is repeated obtaining a polymer having a Tg of about 137.4°C. The intrinsic viscosity, measured at the temperature of 30°C in perfluoroheptane is 40.0 ml/g. By IR analysis the polymer results to contain a residual amount of the polar COOH groups of 6 mmoles/kg polymer.

EXAMPLE 8

Preparation of a copolymer for optical applications according to the process of the present invention, and achievement of the preform, using the amorphous perfluorinated polymer prepared in Example 7.

[0080] Example 2 is repeated, by using the polymer of Example 7, with a fluorination time of 30 h.

[0081] The polymer IR analysis has shown that the concentration of the polar groups is lower than 0.05 mmoles/Kg polymer (method detectability limit).

[0082] In the preform preparation step the polymer is introduced in a test tube having a length of 20 cm and a diameter of 2 cm and kept liquid at the temperature of 280°C for one hour, then slowly cooled, with a decreasing temperature profile, to room temperature in a time of 24 h. A cylinder having 2 cm x 6.34 cm sizes is obtained.

[0083] The polymer cylinder has been subjected to scattering measurements by the Laser Light scattering (LLS) technique as above. The attenuation is equal to 12×10^{-5} dB/cm (12 dB/km) at 514 nm.

[0084] The polymer dissolved at a concentration of 5% by weight in Galden®D80 and filtered on a PTFE membrane

having a maximum pore diameter of 0.2 μm does not leave residues on the filter. The filter, dried at 150°C for 1 h and weighed by a precision balance has the same weight as the initial weight.

5 Claims

1. Amorphous perfluorinated copolymers, comprising cyclic perfluorinated units deriving from at least two different perfluorinated comonomers, optionally with units deriving from a non cyclic perfluorinated monomer, or which does not cyclize during the polymerization, containing at least one olefinic unsaturation (perfluoroolefin), or comprising cyclic perfluorinated units and units deriving from a non cyclic perfluorinated monomer, or which does not cyclize during the polymerization, containing at least one olefinic unsaturation, said perfluorinated copolymers having the following combination of properties:

- substantial absence of unstable polar end groups, in particular end groups as COF, COOH or their amidic derivatives, esters or salts; said end groups being not detectable in the copolymer, i.e. present in an amount lower than 0.05 mmoles/kg polymer when they are determined by Fourier transform IR spectroscopy by Nicolet® Nexus FT-IR equipment (256 scanings, resolution 2 cm^{-1}), wherein:
 - on a sintered polymer powder pellet having 5 mm diameter and thickness from 50 to 300 micron (corresponding to a weight of 1.75 and 10.5 mg of polymer, respectively) a scanning between 4,000 cm^{-1} and 400 cm^{-1} is initially carried out, the pellet being then kept for 12 hours in an environment saturated with ammonia vapours;
 - the IR spectrum is finally recorded under the same conditions of the initial IR spectrum; the two spectra are elaborated by subtracting from the signals of the spectrum relating to the untreated sample (initial spectrum) those corresponding to the specimen spectrum after exposure to ammonia vapours;
 - the "difference" spectrum is obtained, which is normalized by the following equation:

$$\frac{\text{"Difference spectrum"}}{[\text{pellet weight (g)}/\text{pellet area (cm}^2\text{)}]}$$

- the optical densities related to the end groups which have reacted with the ammonia vapours are measured, which give rise to detectable peaks in the IR spectrum, said end groups being the COOH and COF groups;
- the optical densities are converted in mmoles-/kg polymer using the extinction coefficients shown in Table 1, page 73 of the paper by M. Pianca et Al. "End groups in fluoropolymers", J. Fluorine Chem. 95 (1999), 71-84 (herein incorporated by reference); the so found values give the concentrations of the residual polar end groups as mmoles of polar end groups/kg polymer: in the spectrum of the amorphous (per)fluorinated polymers after fluorination bands related to COOH groups (3,600-3,500, 1,820-1,770 cm^{-1}) and/or COF groups (1,900-1,830 cm^{-1}) are not detectable, the method detectability limit being 0.05 mmoles/Kg polymer;
- polymer Tg higher than 120°C, preferably 125°C
- narrow distribution of the monomeric composition of the amorphous perfluorinated copolymer measured according to the following test: the polymer is dissolved at a concentration of 5% w/w in perfluoroheptane solvent, after filtration on PTFE filter having a maximum pore diameter of 0.2 micron, no polymer residue remains on the filter whereby the filter weight before and after filtration remains unchanged.

2. Amorphous perfluorinated copolymers according to claim 1, wherein the perfluorinated monomers which give polymers containing cyclic structures, are selected from the following:

- perfluorodioxoles, wherein optionally one or two fluorine atoms are substituted with chlorine atoms;
- non conjugated dienes having the following formulas:

wherein X^1 and X^2 , equal to or different from each other, are F, Cl; X^3 and X^4 , equal to or different from each other, are F or CF_3 , which during the polymerization cyclopolymerize.

3. Amorphous perfluorinated copolymers according to claim 2, wherein the perfluorodioxoles have the following formula:

wherein R'_{F} is equal to F, R_{F} or OR_{F} wherein R_{F} is a linear or branched when possible perfluoroalkyl radical having 1-5 carbon atoms; X_1 and X_2 equal to or different from each other being F or CF_3 .

4. Amorphous perfluorinated copolymers according to claim 3, wherein in formula (IA) $\text{R}'_{\text{F}} = \text{OR}_{\text{F}}$, R_{F} preferably being

5. Amorphous perfluorinated copolymers according to claim 3, wherein in formula (IA) $\text{R}'_{\text{F}} = \text{F}$; $\text{X}_1 = \text{X}_2 = \text{F}$ (PD).

6. Amorphous perfluorinated copolymers according to claims 1-5, wherein the non cyclic perfluorinated comonomers, or which do not cyclize during the polymerization, containing at least one ethylene unsaturation, are selected from the following:

- C_2 - C_8 perfluoroolefins, such as TFE, hexafluoropropene (HFP);
- (per)fluoroalkylvinylethers (PAVE) $\text{CF}_2=\text{CFOR}_1$, wherein R_1 is a C_1 - C_6 (per)fluoroalkyl, for example CF_3 , C_2F_5 , C_3F_7 ;
- perfluoro-oxyalkylvinylethers $\text{CF}_2=\text{CFOX}$, wherein X is: a C_1 - C_{12} alkyl, or a C_1 - C_{12} oxyalkyl, or a C_1 - C_{12} perfluoro-oxyalkyl having one or more ether groups, for example perfluoro-2-propoxy-propyl.

7. Amorphous perfluorinated copolymers according to claims 1-6, comprising non cyclic C_2 - C_8 fluoroolefins, or which do not cyclize during the polymerization, containing one or two chlorine atoms, preferably chlorotrifluoroethylene (CTFE).

8. Amorphous perfluorinated copolymers according to claims 1-7, wherein when the amorphous polymer optionally contains units deriving from a non cyclic perfluorinated monomer, or which does not cyclize during the polymerization, containing at least one olefinic unsaturation, it contains cyclic units deriving from either different cyclic monomers or a cyclic monomer and a monomer which cyclizes during the polymerization.

9. Amorphous perfluorinated copolymers according to claim 8, wherein the amount expressed in per cent by moles of cyclic units deriving either from different cyclic monomers or from a cyclic monomer and a monomer which cyclizes during the polymerization ranges from 60% to 100% by moles, preferably from 80% to 100%.

10. Amorphous perfluorinated copolymers according to claims 1-7, wherein when the amorphous polymer contains

units deriving from a non cyclic perfluorinated monomer, or which does not cyclize during the polymerization, containing at least one olefinic unsaturation, it contains cyclic units deriving from a cyclic monomer, or from two different cyclic monomers, or from a cyclic monomer and a monomer which cyclizes during the polymerization.

- 5 11. Amorphous perfluorinated copolymers according to claim 10, wherein the amount expressed in per cent by moles of cyclic units deriving from a cyclic monomer, or from two different cyclic monomers or from a cyclic monomer and a monomer which cyclizes during the polymerization ranges from 60% to 99.5%, preferably from 80% to 95%.
- 10 12. Amorphous perfluorinated copolymers according to claims 10-11, optionally comprising a second non cyclic perfluoroolefin or which does not cyclize during the polymerization, different from that already present, selected from the perfluoroolefins of claims 6-7, in amounts in per cent by moles from 0 to 20%, preferably lower than 10%.
13. Amorphous perfluorinated copolymers according to claims 1-12, obtainable by copolymerizing:
 - 15 - the perfluorodioxoles of formula (IA) having TTD structure, with TFE;
 - the perfluorodioxoles of formula (IA) having TTD structure, with perfluorodioxoles of formula (IA), preferably PD.
- 20 14. A process for preparing the amorphous perfluorinated polymers according to claims 1-13, including the homopolymers formed by cyclic units deriving even from only one cyclic monomer or from a monomer which cyclizes during the polymerization, comprising the following steps:
 - 25 I) dissolution of the amorphous perfluorinated polymer in a solvent inert to fluorination, having solubility parameter defined as in Polymer Handbook 3th ed. page VII 519, (Ed. Brandrup and Immergut), from 5.5 to 8.2 (cal/cm³)^{1/2}, the polymer being dissolved at a concentration, expressed in per cent by weight, from 0.5% to 15%, preferably from 3% to 8%;
 - II) polymer fluorination in solution by treatment with elementary fluorine, optionally in admixture with inert gases, in the presence of ultraviolet radiations having a wave length from 200 to 500 nm, working at temperatures lower than 100°C;
 - 30 III) solution filtration after fluorination on PTFE filter having a maximum pore diameter of 0.2 µm, recovery of the filtrate;
 - IV) optionally, solvent removal and recovery of the amorphous perfluorinated polymers usable for optical applications.
- 35 15. A process according to claim 14, wherein in step I) the solvent inert to fluorination, having solubility parameter from 5.5 to 8.2 (cal/cm³)^{1/2} is selected from perfluoroheptane, perfluorobutyl-tetrahydrofuran, perfluoropropyl-tetrahydropyran, perfluoropolyether having b.p. 165°C, tertiary perfluoroamines.
- 40 16. A process according to claims 14-15, wherein in step I) to the organic solution a doping compound is optionally added, in an amount expressed in per cent by weight on the perfluoropolymer, from 1% to 30%, preferably from 5% to 20%.
- 45 17. A process according to claims 14-16, wherein in step II) the reaction temperature ranges from 0°C to < +100°C, preferably from +20°C to +50°C.
- 50 18. A process according to claims 14-17, wherein in step III) the temperature at which the filtration is carried out is in the range 0°-100°C, preferably it is the room temperature (20°-25°C).
19. Preform comprising the amorphous perfluorinated polymers according to claims 1-13.
20. Preform according to claim 19, optionally comprising additives, preferably selected from doping agents and/or perfluoropolyethers, in an amount expressed in per cent by weight on the perfluoropolymer, from 1% to 30%, preferably from 5% to 20%.
- 55 21. Preform according to claim 20, wherein the doping agents are fluorinated compounds substantially C-H bond free and can be selected from the group comprising compounds having a low molecular weight, oligomers and polymers containing an aromatic ring, preferably benzenic or naphthalenic, and/or one or more halogen atoms, selected from Cl, Br and Iodine, or a functional group, preferably a ketonic group or an ether function.

22. Preform according to claim 21, wherein the doping agents are selected from the following: 1,3-dibromo-tetrafluorobenzene, 1,4-dibromo-tetrafluorobenzene, 2-bromotetrafluorobenzotrifluoride, halogenpentafluorobenzene wherein the halogen is as defined in claim 21, decafluorobenzophenone, perfluoroacetophenone, perfluorodiphenyl, chloroheptafluoronaphthalene, bromoheptafluoronaphthalene, chlorotrifluoroethylene oligomers optionally containing a second perfluoroolefinic monomer selected from the monomers indicated in claim 6.
23. Preform according to claims 19-22, comprising perfluoropolyethers containing in the chain one or more of the following units: $-\text{CF}_2-\text{CF}(\text{CF}_3)\text{O}-$, $-\text{CF}(\text{CF}_3)-\text{CF}_2\text{O}-$, $-(\text{CF}_2)_{n1}\text{O}-$ wherein $n1$ is an integer from 2 to 3, $-\text{CFX}_1\text{O}-$ wherein $\text{X}_1 = \text{F}, \text{CF}_3$, said perfluoropolyethers having number average molecular weight from 300 to 10,000, preferably from 500 to 2,500.
24. Manufactured articles for optical applications obtainable with the amorphous perfluorinated polymers according to claims 1-13 or from the preforms according to claims 19-23.

EP 1 256 591 A1

Description

[0001] The present invention relates to amorphous (per)fluorinated polymers substantially unstable ionic end group free, in particular COF, COOH or their corresponding esters, salts or amidic derivatives, said end groups being undetectable by the method reported hereunder.

[0002] More specifically the present invention relates to amorphous (per)fluorinated polymers containing cyclic perfluorinated structures.

[0003] Said polymers are characterized by a high transparency at wave lengths from 150 to 250 nm. Therefore said polymers are usable for achieving protective films in the production of semiconductors by means of microlithographic techniques at 248 nm, 193 nm and 157 nm.

[0004] It is known that amorphous fluorinated polymers when used for microlithographic applications must show the lowest possible absorption with respect to the wave lengths of the incident light. In this application fluoropolymers are required having transparency at lower and lower wave lengths, from 248 nm to 193 nm and preferably even to 157 nm, to have smaller and smaller and quicker and quicker chips.

[0005] The amorphous fluorinated polymers are characterized by a high transparency in a wide range of wave lengths, however at wave lengths lower than 250 nm the transparency is not high. This is mainly due to the fact that the amorphous polymers, obtained by the known conventional syntheses of the prior art, contain unstable polar ionic end groups, mainly of the COF, COOH type, which absorb at wave lengths lower than 250 nm, reducing the film transparency of the amorphous (per)fluorinated polymer to said wave length ranges.

[0006] Various processes to decrease or neutralize the residual amounts of said polar end groups are known in the prior art, however the known methods do not allow to lead to a substantial elimination of ionic end groups, in particular the COF and COOH end groups.

[0007] One of the methods used to neutralize the acid end groups in polymers is by fluorination: the fluorinating agent is generally elementary fluorine, but also other fluorinating agents are used.

[0008] The polymer can be fluorinated under solid form as described in USP 4,743,658, or dissolved in solvents which are stable to fluorination, as described in EP 919,060. Both treatments are carried out at high temperatures, particularly of the order of 200°C, with fluorine diluted with inert gas. Or, before fluorination a pre-treatment of the end groups can be carried out with tertiary amines or alcohols to favour the subsequent fluorination reaction. The temperatures are in the range 75°C-200°C and must be lower than the polymer Tg. See patent application WO 89/12,240 and USP 4,966,435.

[0009] By said methods of the prior art a reduction of the polar end groups is obtained but not their substantially complete elimination. Besides, in some cases during the process other polar end groups such as for example COF are formed. See the comparative Examples.

[0010] The residual presence of polar end groups in amorphous (per)fluorinated polymers, as said, worsens their optical properties and compromises the use thereof in the microlithography field, in particular at wave lengths lower than 200 nm, more particularly lower than 180 nm.

[0011] The Applicant has unexpectedly and surprisingly found (per)fluorinated amorphous polymers substantially ionic end group free, in particular COF, COOH, their esters, salts or amidic derivatives, on the basis of the analysis method reported hereunder.

[0012] An object of the present invention are amorphous (per)fluorinated polymers substantially unstable ionic end group free, in particular COF, COOH or their amidic derivatives, esters or salts, said end groups being undetectable by the method reported below, i.e. each end group being in a total amount lower than 0.05 mmoles/Kg polymer; the determination method of acid end groups being the Fourier transform IR spectroscopy by Nicolet® Nexus FT-IR equipment (256 scannings, resolution 2 cm⁻¹), wherein on a sintered polymer powder pellet having a 5 mm diameter and thickness from 50 to 300 microns (1.75 - 10.5 mg of polymer) a scanning between 4,000 cm⁻¹ and 400 cm⁻¹ is initially carried out, the pellet being then kept for 12 hours in an environment saturated with ammonia vapours, and finally recording the IR spectrum under the same conditions of the initial IR spectrum; elaborating the two spectra by subtracting from the signals of the spectrum relating to the untreated sample (initial spectrum) the corresponding ones of the specimen spectrum after exposure to ammonia vapours, obtaining the "difference" spectrum, which is normalized by the following equation:

$$\frac{\text{"Difference spectrum"}}{[\text{pellet weight (g)/pellet area (cm}^2\text{)}]}$$

[0013] The optical densities related to the end groups which have reacted with the ammonia vapours are determined; said end groups being the COOH and COF end groups, that with ammonia vapours give rise to detectable peaks; the optical densities are converted in mmoles/kg polymer using the extinction coefficients reported in Table 1, page 73 of

the paper by M. Pianca et Al. "End groups in fluoropolymers", J. Fluorine Chem. 95 (1999), 71-84 (herein incorporated by reference); the found values express the concentrations of the residual polar end groups as mmoles of polar end groups/kg of polymer: in the spectrum of the amorphous (per)fluorinated polymers bands related to COOH groups ($3,600-3,500$, $1,820-1,770$ cm^{-1}) and/or COF groups ($1,900-1,830$ cm^{-1}) are not detectable, the method detectability limit being 0.05 mmoles/Kg polymer.

[0014] More particularly the present invention relates to amorphous (per) fluorinated polymers containing cyclic perfluorinated structures.

[0015] With amorphous polymers according to the present invention, besides the properly said amorphous polymers, also semicrystalline polymers are meant, provided that they are soluble in perfluorinated solvents for at least 1% by weight at temperatures in the range $0^{\circ}\text{C}-100^{\circ}\text{C}$, preferably $20^{\circ}\text{C}-50^{\circ}\text{C}$. The completely amorphous polymers show only glass transition temperatures but not melting temperatures; semicrystalline polymers show one glass transition temperature and melting temperatures.

[0016] As perfluorinated solvents, perfluoroalkanes, perfluoropolyethers, preferably having boiling point lower than 200°C , such as for example Galden® LS165, tertiary perfluoroamines, etc., can for example be mentioned.

[0017] The amorphous polymers according to the present invention contain one or more of the following fluorinated comonomers:

- C_2-C_8 perfluoroolefins, such as tetrafluoroethylene (TFE) hexafluoropropene (HFP);
- C_2-C_8 chloro-fluoroolefins, such as chlorotrifluoroethylene (CTFE);
- $\text{CF}_2=\text{CFOR}_1$ (per)fluoroalkylvinylethers (PAVE), wherein R_1 is a C_1-C_6 (per)fluoroalkyl, for example CF_3 , C_2F_5 , C_3F_7 ;
- $\text{CF}_2=\text{CFOX}$ (per)fluoro-oxyalkylvinylethers, wherein X is: a C_1-C_{12} alkyl, or a C_1-C_{12} oxyalkyl, or a C_1-C_{12} (per)fluoro-oxyalkyl having one or more ether groups, for example perfluoro-2-propoxy-propyl;
- fluorosulphonic monomers, preferably selected from the following:

- $\text{F}_2\text{C}=\text{CF}-\text{O}-\text{CF}_2-\text{CF}_2-\text{SO}_2\text{F}$;
- $\text{F}_2\text{C}=\text{CF}-\text{O}-[\text{CF}_2-\text{CXF}-\text{O}]_n-\text{CF}_2-\text{CF}_2-\text{SO}_2\text{F}$

wherein X = Cl, F or CF_3 ; $n = 1-10$

- $\text{F}_2\text{C}=\text{CF}-\text{O}-\text{CF}_2-\text{CF}_2-\text{CF}_2-\text{SO}_2\text{F}$;

- fluorodioxoles, preferably perfluorodioxoles;
- non conjugated dienes of the type:

wherein X^1 and X^2 , equal to or different from each other, are F, Cl or H; X^3 and X^4 , equal to or different from each other, are F or CF_3 , which during the polymerization cyclopolymerize.

[0018] Among fluorodioxoles the ones of formula:

can be mentioned, wherein R'_{F} is equal to F, R_{F} or OR_{F} wherein R_{F} is a linear or branched when possible perfluoroalkyl radical having 1-5 carbon atoms; X_1 and X_2 equal to or different from each other being F or CF_3 .

[0019] Preferably in formula (IA) $\text{R}'_{\text{F}} = \text{OR}_{\text{F}}$, R_{F} preferably is CF_3 ; $\text{X}_1 = \text{X}_2 = \text{F}$, and the compound is herein indicated as TTD.

[0020] When cyclic monomers or monomers which in polymerization generate cyclic structures are present, the

amount of said monomers generally ranges from 15 to 100% by moles; preferably from 25% to 100%.

[0021] When the cyclic monomer is TTD, the amount % by moles in the polymer ranges from 40 to 95%.

[0022] The comonomers which can be copolymerized with cyclic monomers or which cyclize in polymerization are selected from one or more of the following: TFE, chlorotrifluoroethylene (CTFE), hexafluoropropene (HFP), perfluoroalkylvinylethers or perfluorooxyalkylvinylethers as above defined.

[0023] The preferred copolymers according to the present invention are the copolymers of TTD with tetrafluoroethylene, the other comonomers when present are generally in amounts ranging from 0% by moles to 20% by moles, preferably lower than 10% by moles.

[0024] The TTD dioxoles and the respective homopolymers and copolymers according to the present invention are prepared for example according to USP 5,498,682 and USP 5,883,177.

[0025] Other amorphous polymers which can be used according to the present invention not containing cyclic structures are based on TFE and HFP, optionally containing perfluorovinylethers as above defined, preferably perfluoromethylvinylether (PMVE), perfluoroethylvinylether (PEVE), perfluoropropyl-vinylether (PPVE).

[0026] The amorphous polymers of the present invention can be prepared according to polymerization methods in emulsion, preferably in microemulsion, in suspension or in bulk according to known methods of the prior art. In particular the amorphous polymers of the present invention can be prepared by copolymerization of monomers in aqueous emulsion, according to known methods of the prior art, in the presence of radical initiators, for example persulphates, phosphates, alkaline or ammonium perborates or percarbonates, optionally in combination with ferrous, cuprous or silver salts, or of other easily oxidizable metals. In the reaction medium also surfactants of various type are usually present, among which fluorinated surfactants are particularly preferred. The polymerization reaction is generally carried out at temperatures in the range 25°-150°C, under pressure up to 10 MPa. The preparation is preferably carried out in microemulsion of (per)fluoropolyoxyalkylenes, according to USP 4,789,717 and USP 4,864,006. Optionally in polymerization also well known chain transfer agents of the prior art can be used.

[0027] A further object of the present invention is a process for preparing the amorphous (per)fluorinated polymers of the present invention, containing reduced amounts or substantially ionic end group free as above defined, by treatment with elementary fluorine, optionally in admixture with inert gases, in a solvent inert to fluorination, in the presence of ultraviolet radiations having wave length from 200 to 500 nm, operating at temperatures lower than 100°C.

[0028] The used radiation has a wave length ranging from 200 to 500 nm, emitted for example from a mercury lamp Hanau TQ 150.

[0029] The reaction temperature preferably ranges from 0°C to +100°C, preferably from +20°C to +50°C.

[0030] Preferably the polymer concentration in the perfluorinated solvent is in the range 1-11% by weight.

[0031] At the end of the fluorination the solvent can be recovered by distillation and suitably reused.

[0032] As said, the determination of the acid end groups before and after the fluorination is carried out by IR spectroscopy, performing a scanning between 4,000 cm^{-1} and 400 cm^{-1} , on a sintered polymer powder pellet which can have a thickness from 50 to 300 micron. The fluorination process ends when by IR spectroscopy bands relating to COOH groups (3,600-3,500, 1,820-1,770 cm^{-1}) and/or COF groups (1,900-1,830 cm^{-1}) are no longer detectable. The method detectability limit is 0.05 mmoles/Kg polymer.

[0033] As said, the polymers of the invention are characterized by a high transparency in a wide range of wave lengths, in particular from 150 to 250 nm. Therefore said polymers are usable for achieving transparent protective films in the semiconductor production by microlithographic techniques in the above wave length range and in particular at 248 nm, 193 nm and 157 nm.

[0034] The protective films are applied by casting, spin coating or other conventional methods.

[0035] The following Examples illustrate the invention and do not limit the scope thereof.

EXAMPLES

Determination of the ionic end groups by IR spectroscopy

[0036] A small amount of the specimen (3.5 mg) is put under a press (3.5 ton/ cm^2) and a pellet having a 5 mm diameter and 100 microns thickness is prepared.

[0037] The spectrum from 4,000 to 400 cm^{-1} is recorded by Nicolet® Nexus FT-IR equipment (256 scanings, resolution 2 cm^{-1}).

[0038] The pellet is transferred in an environment saturated with ammonia vapours. After 12 hours the specimen is taken from the ammonia saturated environment and the IR spectrum is recorded again under the same conditions.

[0039] By subtracting from the signals of the spectrum relating to the specimen as such the corresponding ones of the specimen spectrum after exposure to ammonia vapours, the "difference" spectrum is obtained, which is normalized by the following equation:

$$\frac{\text{"Difference spectrum"}}{[\text{pellet weight (g)/pellet area (cm}^2\text{)}]}$$

[0040] The optical densities related to the end groups which have reacted with the ammonia vapours are determined. They are generally COOH or COF groups. The optical densities are transformed into mmols/kg polymer using the extinction coefficients reported in Table 1, page 73 of the paper by M. Pianca et Al. "End groups in fluoropolymers", J. Fluorine Chem. 95 (1999), 71-84. The found values express the concentrations of the residual polar end groups as mmols of polar end groups/kg of polymer.

EXAMPLE 1 (comparative)

[0041] General fluorination process of end groups at room temperature in absence of UV radiation and solvent

[0042] 14 g of amorphous TFE-TTD copolymer, TFE/TTD ratio 41/59 moles, prepared according to Example 2 of USP 5,883,177 and dried in nitrogen flow (1 NI/h) for one hour at 100°C, are introduced in a 50 ml glass reactor, equipped with porous septum for the gas inlet. This polymer had an initial content of COOH end groups of 6.1 mmols/Kg.

[0043] Then a mixture 1:1 by moles of nitrogen/fluorine (1 NI/h) is fed at 25°C for one hour, then pure fluorine (1 NI/h) for 25 h. At the end of the reaction nitrogen is fed to wash the reactor (0.5 h), then a polymer specimen is analyzed by IR.

[0044] At the end of the fluorination the residual COOH end groups are in an amount of 1 mmole/Kg and the COF ones of 3.9 mmols/Kg.

EXAMPLE 2 (comparative)

[0045] General fluorination process of end groups at 80°C in absence of UV radiation and solvent

Example 1 is repeated except that pure fluorine is fed for 10 hours into the reactor maintained at 80°C.

[0046] At the end of the fluorination the residual COOH end groups are in an amount of 1.1 mmols/Kg and the COF end groups of 3.3 mmols/Kg.

EXAMPLE 3 (comparative)

General fluorination process of end groups at 100°C in absence of UV radiation and solvent

[0047] Example 1 is repeated except that pure fluorine is fed for 10 hours in the reactor maintained at 100°C.

[0048] At the end of the fluorination the residual COOH end groups are in an amount of 0.6 mmols/Kg and the COF end groups of 4.3 mmols/Kg.

EXAMPLE 4 (comparative)

Fluorination process of the end groups at 25°C in absence of UV radiation, wherein a solvent is used

[0049] 2 g of the copolymer of Example 1 and 40 ml of Galden® LS165 (perfluoropolyether having boiling point 165°C) are fed into a 100 ml Monel reactor. The autoclave is brought to reduced pressure and it is brought again to atmospheric pressure with nitrogen. The step is repeated a second time. After having reduced the pressure again in the reactor, pure fluorine is fed until reaching 0.3 MPa.

[0050] The autoclave is left under stirring at 25°C for 30 hours.

[0051] The fluorine in excess and the solvent are removed at reduced pressure.

[0052] At the end of the fluorination the residual COOH end groups are in an amount of 1.1 mmols/Kg and the formed COF end groups of 0.9 mmols/Kg.

EXAMPLE 5 (comparative)

Fluorination process of the end groups according to Example 4 of EP 918,060

[0053] 90 g of a solution at 6% by weight of the copolymer used in Example 4 in perfluorotributylamine solvent are fed into a 100 ml Monel reactor. The autoclave is brought to reduced pressure and then to atmospheric pressure with nitrogen. The step is repeated a second time. After having reduced the pressure again in the reactor, a 5:1 mixture by

volume nitrogen/fluorine is fed until reaching the pressure of 0.7 MPa.

[0054] The autoclave is kept under stirring at 195°C for 10 hours.

[0055] The fluorine in excess and the solvent are removed at reduced pressure.

[0056] At the end of the fluorination the residual COOH end groups are in an amount of 1.4 mmoles/Kg and the COF end groups of 2.5 mmoles/Kg.

EXAMPLE 6

Fluorination process of the end groups in the presence of UV light and solvent

[0057] 420 g of solution at 6% by weight of copolymer used in comparative Example 1 in perfluorinated solvent Galden® D100 (perfluoropolyether having b.p. 100°C) are fed into a 300 ml photochemical glass reactor equipped with mechanical stirrer and mercury vapour UV immersion lamp (Hanau TQ 150). Nitrogen is fed into the solution for 1 h to remove the present oxygen, then a mixture 1:1 by volume of nitrogen/fluorine is fed in the presence of the UV radiations for 30 h at 25°C. After reaction the residual fluorine and the solvent are removed using a reduced pressure.

[0058] The total amount of residual end groups results lower than the method sensitivity limit, and therefore it is lower than 0.05 mmoles/Kg polymer.

EXAMPLE 7

Preparation of copolymer TFE/TTD 60/40

[0059] 2790 ml of demineralized water, 6.67 g/litre H₂O of microemulsion prepared as described in USP 4,864,006 are introduced in sequence in a 5 l AISI 316 autoclave, equipped with stirrer working at 650 rpm, after vacuum has been made by oil pump. The autoclave is heated up to 75°C and at this temperature 33.3 g/litre H₂O of TTD are added. The pressure inside the autoclave is brought to 1.4 MPa by TFE gas, subsequently 210 cc of a solution 0.0925 M of potassium persulphate are introduced. After about 10 minutes the reaction starts. The reaction pressure is maintained constant by feeding in a semicontinuous way, at each decrease of the inner pressure of 0.05 MPa, liquid TTD and gaseous TFE in the ratio by weight TTD/TFE = 1.4. The reaction is stopped after having fed in all about 320 g of TTD. The latex is degassed and it has a 15% by weight concentration of solid. It is then coagulated with HNO₃ at 65% w/w, separated from the aqueous phase, washed twice with demineralized water and dried in stove at 85°C for 100 h.

[0060] The polymer Tg is about 90°C. The polymer is therefore amorphous. At the IR analysis the polymer results to contain a residual amount of polar COOH groups of 12 mmoles/kg.

EXAMPLE 7A

Fluorination process of the end groups in the presence of UV light and solvent

[0061] Under the same experimental conditions and operating procedures used in Example 6, the TFE/TTD copolymer of Example 7, dissolved at 5.6% by weight concentration in Galden® LS165, is fluorinated.

[0062] After 34 hours of fluorination, by the above method by IR spectroscopy it is verified that there are no longer detectable peaks of COOH and COF end groups.

EXAMPLE 8

Preparation copolymer CTFE/TTD 75/25

[0063] 3,300 ml of demineralized water, 24 g of microemulsion prepared according to USP 4,864,006 and 490 g of TTD are introduced in sequence in a 5 l autoclave in Hastelloy C, equipped with stirrer at 650 rpm, after vacuum has been made by oil pump. The reactor is heated to 75°C and brought to the pressure of 1.4 MPa by gaseous CTFE. Then 30 ml of a solution 23 g/litre of potassium persulphate in water are introduced. The internal pressure is maintained constant by additions of CTFE when the internal pressure decreases of 0.025 MPa. Contemporaneously 0.5 g of TTD are fed for each gram of CTFE reacted in the polymerization. At the 4th and 8th hour of reaction 15 ml aliquots of the initiator solution are introduced into the autoclave. After about 11 hours the reaction is stopped evacuating the reactor from the reacting gaseous mixture: a latex containing 17% by weight of solid is discharged. The latex is coagulated by cooling at -20°C, treatment with HNO₃ 65% by weight. After recovery from the aqueous phase it is washed twice with demineralized water and dried in stove at 90°C for 48 h. The copolymer has a Tg of 104°C and therefore it is amorphous. The amount of COOH end groups is 7.0 mmoles/kg.

EXAMPLE 8A

Fluorination process of end groups in the presence of UV light and solvent

- 5 [0064] Under the same experimental conditions and operating procedures used in Example 6 the CTFE/TTD copolymer of Example 8 is fluorinated, dissolved in solution at 4% by weight in solvent Galden® D100.
 [0065] After 29 hours of fluorination, by the above method by IR spectroscopy, it is verified that there are no longer detectable peaks of the COOH and COF end groups.

10 EXAMPLE 9

Fluorination process of end groups in the presence of UV light and solvent

- 15 [0066] Under the same experimental conditions and operating procedures used in Example 6, the TFE/TTD 22/78 copolymer, prepared according to Example 5 of USP 5,883,177, is fluorinated, dissolved in solution at 5% by weight in Galden® D100. The polymer has an initial content of COOH end groups of 7.0 mmoles/kg.
 [0067] After 13 hours of fluorination, by IR analysis, 1 mmole/kg polymer of residual COOH end groups and 1.4 mmoles/kg polymer of COF end groups which have formed are still found.
 [0068] After 29 hours of fluorination, by IR analysis, peaks attributable to COOH and COF end groups are not detectable.

20 EXAMPLE 10 (comparative)

Fluorination in solution at 230°C, in absence of UV light

- 25 [0069] 90 g of a solution at 1.3% by weight of the copolymer used in Example 4, dissolved in solvent Galden® D100, are fed into a 100 ml Monel reactor. The autoclave is brought to reduced pressure and then the atmospheric pressure is restored with nitrogen. The step is repeated a second time. After having reduced the pressure again, a 1:1 mixture by volume nitrogen/fluorine is fed into the reactor until reaching a pressure value of 1.9 MPa.
 30 [0070] The autoclave is kept under stirring at 230°C for 12 hours.
 [0071] At the end the fluorine in excess and the solvent are removed at reduced pressure.
 [0072] The polymer residual COOH end groups are in an amount of 4.9 mmoles/Kg and the formed COF end groups of 11 mmoles/Kg.

35 EXAMPLE 11 (comparative)

Fluorination process of the end groups in the presence of UV light, in absence of solvent

- 40 [0073] 14 g of the copolymer used in Example 1 are transferred in a 20 cc quartz phial. Nitrogen is fed into the reactor for 1 h to remove the present oxygen, then pure fluorine is fed (1.3 NI/h) in the presence of the UV radiations, emitted from a lamp placed outside the reactor, for 25 h at 20°C. After reaction the residual fluorine and the solvent are removed at reduced pressure.
 [0074] At the end of the fluorination the residual COOH end groups are in an amount of 1.6 mmoles/Kg and the COF ones of 2.4 mmoles/Kg.

45 EXAMPLE 12

Determination of the transmittance by UV spectroscopy

- 50 [0075] A solution of the copolymer used in Example 9 but at a 10% by weight concentration, having an initial content of COOH end groups of 7.0 mmoles/kg, is filtered by a 0.2 microns porous septum and transformed in a film by casting, obtaining a film having a 20 microns thickness.
 [0076] The film transmittance is determined in the range from 800 to 200 nm by a UV-Visible Perkin Elmer Lambda 2 spectrometer.
 55 [0077] The transmittance value at 200 nm is 79.3%. Another film specimen is prepared, having the same thickness as the previous one, by using the same technique, utilizing the partially fluorinated copolymer (fluorination time 13 hours) of Example 9. The film transmittance at 200 nm is equal to 89%.
 [0078] The analysis repeated on the exhaustively fluorinated copolymer specimen of Example 9 gives a transmittance

> 95%.

Claims

- 1: Amorphous (per)fluorinated polymers containing an amount lower than 0.05 mmoles/kg polymer of each of the following ionic end groups: COF, COOH, their amidic derivatives, esters or salts, when the used determination method for said end groups is the Fourier Transform IR spectroscopy by Nicolet® Nexus FT-IR equipment (256 scannings, resolution 2 cm⁻¹), wherein on a sintered polymer powder pellet having a 5 mm diameter and thickness from 50 to 300 microns, a scanning between 4,000 cm⁻¹ and 400 cm⁻¹ is initially carried out, then maintaining the pellet for 12 hours in an environment saturated with ammonia vapours; and finally recording the IR spectrum under the same conditions of the initial IR spectrum; elaborating the two spectra by subtracting from the signals of the spectrum relating to the untreated sample (initial spectrum) the corresponding ones of the specimen spectrum after exposure to ammonia vapours, obtaining the "difference" spectrum, which is normalized by the following equation:

$$\frac{\text{"Difference spectrum"}}{[\text{pellet weight (g)}/\text{pellet area (cm}^2\text{)}]}$$

measuring the optical densities related to the end groups which have reacted with the ammonia vapours, converting then the optical densities in mmoles/kg polymer using the extinction coefficients reported in Table 1, page 73 of the paper by M. Pianca et Al. "End groups in fluoropolymers", J. Fluorine Chem. 95 (1999), 71-84.

2. Amorphous (per) fluorinated polymers according to claim 1, containing cyclic perfluorinated structures.
3. Per)fluorinated polymers according claims 1-2, wherein the amorphous polymers are selected from the properly said amorphous polymers and semicrystalline polymers soluble in perfluorinated solvents for at least 1% by weight at temperatures in the range 0°C-100°C, preferably 20°C-50°C.
4. Semicrystalline (per)fluorinated polymers according to claim 3, wherein the perfluorinated solvents are selected from the group comprising perfluoroalkanes, perfluoropolyethers, preferably having boiling point lower than 200°C, tertiary perfluoroamines.
5. Per)fluorinated polymers according to claims 1-4, containing one or more of the following fluorinated comonomers:
- C₂-C₈ perfluoroolefins, preferably tetrafluoroethylene (TFE) hexafluoropropene (HFP);
 - C₂-C₈ chloro-fluoroolefins, preferably chlorotrifluoroethylene (CTFE);
 - CF₂=CFOR_f (per)fluoroalkylvinylethers (PAVE), wherein R_f is a C₁-C₆ (per)fluoroalkyl, preferably CF₃, C₂F₅, C₃F₇;
 - CF₂=CFOX (per)fluoro-oxyalkylvinylethers, wherein X is selected from the following: C₁-C₁₂ alkyl, C₁-C₁₂ oxy-alkyl, C₁-C₁₂ (per)fluoro-oxyalkyl having one or more ether groups, preferably perfluoro-2-propoxy-propyl;
 - fluorosulphonic monomers, preferably selected from the following:
 - F₂C=CF-O-CF₂-CF₂-SO₂F ;
 - F₂C=CF-O- [CF₂-CXF-O]_n-CF₂-CF₂-SO₂F

wherein X = Cl, F or CF₃; n = 1-10
 - F₂C=CF-O-CF₂-CF₂-CF₂-SO₂F;
 - fluorodioxoles, preferably perfluorodioxoles;
 - non conjugated dienes of the type:
 - CF₂=CFOCF₂CF₂CF=CF₂;
 - CFX¹=CX²OCX³X⁴OCX²=CX¹F

wherein X¹ and X², equal to or different from each other, are F, Cl or H; X³ and X⁴, equal to or different from each other, are F or CF₃.

6. Per)fluorinated polymers according to claim 5, wherein the fluorodioxoles have the formula:

wherein R'_{F} is equal to F, R_{F} or OR_{F} wherein R_{F} is a linear or branched when possible perfluoroalkyl radical having 1-5 carbon atoms; X_1 and X_2 equal to or different from each other being F or CF_3 .

7. Per)fluorinated polymers according to claim 6, wherein in the formula (IA) $\text{R}'_{\text{F}} = \text{OR}_{\text{F}}$, R_{F} preferably is CF_3 ; $\text{X}_1 = \text{X}_2 = \text{F}$.
8. Per) fluorinated polymers according to claim 2-7, wherein the amount of cyclic monomers or of monomers which in polymerization generate cyclic structures ranges from 15 to 100% by moles; preferably from 25% to 100%.
9. Per)fluorinated polymers according to claim 8, wherein the cyclic monomer is the dioxole of claim 7 and the comonomer is tetrafluoroethylene.
10. Per)fluorinated polymers according to claim 9, wherein the amount % by moles of the cyclic monomer ranges from 40 to 95%.
11. Per)fluorinated polymers according to claims 2-10, wherein the comonomers copolymerizable with cyclic monomers or which cyclize in polymerization are selected from one or more of the following: TFE, chlorotrifluoroethylene (CTFE), hexafluoropropene (HFP), perfluoroalkylvinylethers or perfluorooxyalkylvinylethers.
12. Per)fluorinated polymers according to claims 1-11, comprising the dioxole of claim 7, tetrafluoroethylene and optionally other comonomers in amounts % by moles in the range 0%-20%, preferably lower than 10% by moles.
13. Per)fluorinated polymers according to claims 1-5, wherein the (per)fluorinated polymers are based on TFE and HFP, optionally containing perfluorovinylethers as above defined, preferably perfluoromethylvinylether (PMVE), perfluoroethylvinylether (PEVE), perfluoropropylvinylether (PPVE).
14. A process for preparing amorphous (per)fluorinated poly-mers of claims 1-13, by treatment with elementary fluorine, optionally in admixture with inert gases, in a solvent inert to fluorination, in the presence of ultraviolet radiations having wave length from 200 to 500 nm, operating at temperatures lower than 100°C.
15. A process according to claim 14, wherein the used radiation has a wave length ranging from 200 to 500 nm.
16. A process according to claims 14-15, wherein the reaction temperature ranges from 0°C to +100°C, preferably from +20°C to +50°C.
17. A process according to claims 14-16, wherein the polymer concentration in the perfluorinated solvent is in the range 1-11% by weight.
18. Use of the polymers according to claims 1-13, for optical applications, in particular optical fibers and for preparing transparent protective films for microlithographic applications.
19. Use according to claim 18, wherein the protective films are transparent from 150 to 250 nm.

ANNEX TO THE EUROPEAN SEARCH REPORT ON EUROPEAN PATENT APPLICATION NO.

EP 02 00 9416

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report. The members are as contained in the European Patent Office EDP file on
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
